

Just for fun

transport_equation

Equation $\phi_t(x, t) + \theta(x) \cdot \nabla_x \phi(x, t) = f(x, t)$. Applying Backward Euler method,

$$\frac{\phi(x, t + \delta t) - \phi(x, t)}{\delta t} + \theta(x) \cdot \nabla_x \phi(x, t + \delta t) = f(x, t + \delta t).$$

The weak formulation reads

$$\int_{\Omega} \phi(x, t + \delta t) \psi(x) + \delta t \theta(x) \cdot \nabla_x \phi(x, t + \delta t) \psi(x) dx = \int_{\Omega} (\phi(x, t) + \delta t f(x, t + \delta t)) \psi(x) dx$$

modified_transport_eq

Equation $u_t + V \cdot \nabla u = f$. Change of variable $w = \exp(-\lambda t) u$. Then $u = \exp(\lambda t) w$ and

$$\exp(\lambda t) w_t + \lambda \exp(\lambda t) w + \exp(\lambda t) V \cdot \nabla w = f,$$

$$w_t + V \cdot \nabla w + \lambda w = \exp(-\lambda t) f.$$

Applying the θ -method to

$$w_t = \exp(-\lambda t) f - V \cdot \nabla w - \lambda w$$

we have

$$\begin{aligned} \frac{w_{j+1} - w_j}{\Delta t} &= \theta \exp(-\lambda t_{j+1}) f_{j+1} + (1 - \theta) \exp(-\lambda t_j) f_j \\ &\quad - \theta V \cdot \nabla w_{j+1} - (1 - \theta) V \cdot \nabla w_j \\ &\quad - \theta \lambda w_{j+1} - (1 - \theta) \lambda w_j \end{aligned}$$

that is

$$\begin{aligned} 0 &= w_{j+1} - w_j \\ &\quad - \Delta t \theta \exp(-\lambda t_{j+1}) f_{j+1} - \Delta t (1 - \theta) \exp(-\lambda t_j) f_j \\ &\quad + \Delta t \theta V \cdot \nabla w_{j+1} + \Delta t (1 - \theta) V \cdot \nabla w_j \\ &\quad + \Delta t \theta \lambda w_{j+1} + \Delta t (1 - \theta) \lambda w_j \end{aligned}$$

If $\theta = 0$, then

$$w_{j+1} = w_j (1 - \Delta t \lambda) + \Delta t \exp(-\lambda t_j) f_j - \Delta t V \cdot \nabla w_j.$$

If $\theta = 1$, then

$$w_{j+1} (1 + \Delta t \lambda) + \Delta t V \cdot \nabla w_{j+1} = w_j + \Delta t \exp(-\lambda t_{j+1}) f_{j+1}.$$

If $\theta = \frac{1}{2}$, then

$$w_{j+1} \left(1 + \frac{\Delta t}{2} \lambda \right) + \frac{\Delta t}{2} V \cdot \nabla w_{j+1} = w_j \left(1 - \frac{\Delta t}{2} \lambda \right) - \frac{\Delta t}{2} V \cdot \nabla w_j + \frac{\Delta t}{2} (\exp(-\lambda t_{j+1}) f_{j+1} + \exp(-\lambda t_j) f_j)$$
